NCM 0409.00.00

Founded in 1992, the association was created to strengthen regional beekeeping, bringing together producers with the goal of promoting the sustainable development of the activity, adding value to honey production, and expanding access to national and international markets.

It operates by offering technical assistance, training, incentives for good production practices, traceability, and compliance with the requirements of the Federal Inspection Service (SIF) and export certifications. It contributes to income generation, environmental preservation, strengthening of family farming, and recognition of the quality of Brazilian honey, encouraging innovation, competitiveness, and sustainable growth of the entire regional beekeeping chain.

The association sells conventional and organic honey in retail sizes, in various packaging options for the end consumer, and in bulk, serving industries, distributors, and exporters. It also offers co-packing services (private label), bottling honey under the client's brand, according to packaging specifications, labeling, and quality requirements, always in compliance with current health and inspection regulations.

As a differentiator, the association works exclusively with honey produced by its associates, ensuring rigorous quality control, complete traceability, and origin guarantee of the raw material. Its structure allows for flexible service to different market demands, offering portioned products, bulk honey, and personalized bottling solutions (private label).

Furthermore, it has experience supplying national and international markets, meeting the sanitary, quality, and export requirements demanded by major consumer markets. These differentiators provide reliability, process standardization, food safety, product customization, and greater added value for industries, distributors, retailers, exporters, and final consumers.

DETAILS ON PRODUCTION CAPACITY, SEASONALITY AND OTHER CHARACTERISTICS:

We have a production capacity of 200 tons per year, considering the current raw material production of our associates. The harvest season occurs between January and June and from August to October, ensuring supply throughout these harvest periods.
