## HONEY AND BEE DERIVATIVES

NCM 0409.00.00

NCM 0410.00.00

## COMPANY

The company is based in Prudentópolis, in the south-central region of Paraná, which has approximately 8,000 rural properties, mostly family farmers, with a high rate of cancer and suicides. It is the 3rd largest producer of APIS honey and the largest producer of ASF - Stingless Bee - honey in the state, with a protocol with the INPI for a Geographical Indication for APIS and ASF honey.

The work began with training biodynamic farmers away from pesticides. At the rural headquarters we work with regenerative tourism, training, organic gardening, lavender, meliponiculture and beekeeping. The company advises **AASPRUD - the Association of Family Farmers** - on the process of organic certification and the delivery of products to schools, hospitals, etc. The company will advise on the production and marketing of honeys and their derivatives.

## PRODUCTS

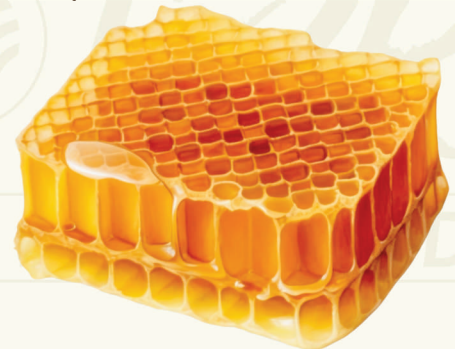

Prudentópolis is part of the Atlantic Forest biome and much of the municipality is covered by Araucaria Forest. The main characteristic of honey is that it is a differentiated product because the bees visit different types of flowers, making it a unique product with an indescribable flavor.

Regenerative Tourism, Training and Honey

APIS honey - stinging bee and ASF honey - stingless bee  
Regenerative tourism  
Training courses

Honey production in our region runs from August to February, with a few exceptions from March to May.

### DETAILS ON PRODUCTION CAPACITY, SEASONALITY AND OTHER CHARACTERISTICS:

**Current production of APIS honey:**  
300,000 kg in the municipality for purchase by producers

**Current production of ASF honey:**  
3000 kg the municipality to buy from producers
