COMPANY

RENOVARE is located in one of the most privileged regions of the Brazilian Semi-Arid Northeast, with exceptional edaphoclimatic conditions for the cultivation of high-quality tropical fruits with distinctive organoleptic properties. Furthermore, it has access to an important underground water source, a natural resource that contributes significantly to the environmentally sound development of crops and to the excellence of the fruits produced in our production unit.

The company achieves greater production uniformity, adds value to its products, and offers consumers a superior experience based on authenticity, freshness, and excellence.

PRODUCTS

The unique combination of fertile soil, favorable climatic conditions, and excellent water resources allows for the development of fruits with superior characteristics, standing out for their more intense flavor, distinctive aroma, attractive color, and high quality standard. Our watermelons, melons, and pumpkins are produced under strict technical criteria, with specialized monitoring at every stage of the production process, from soil preparation and crop establishment to harvesting and post-harvest handling. The entire production system follows strict environmental, phytosanitary, and quality control protocols, ensuring traceability, sustainability, and product excellence.

Grown in the state of Rio Grande do Norte, the melons and watermelons benefit from a region internationally recognized for its ideal production conditions and its status as a Fruit Fly-Free Zone, a factor that guarantees high phytosanitary standards and access to the most demanding markets in the world. The high solar incidence throughout the production cycle favors the accumulation of natural sugars, resulting in fruits with higher Brix content, more sweetness, flavor, and quality.

Furthermore, the fruits exhibit excellent firmness, uniformity, and post-harvest shelf life, characteristics that contribute to superior logistical performance, reduced losses, and greater end-consumer satisfaction, consolidating the company's reputation as a supplier of high-quality products to national and international markets.

DETAILS ON PRODUCTION CAPACITY, SEASONALITY AND OTHER CHARACTERISTICS:

We have the capacity to plant between 10 and 15 hectares per month, resulting in an estimated production of 300 to 450 tons per month. Our production structure allows for efficient expansion to meet new contracts and opportunities in national and international markets, while maintaining high standards of quality and consistency in supply.
