

HONEY AND BEE DERIVATIVES

COMPANY

Rubee Apis was founded by a Swiss doctor and Juliana Cecchetto, a biologist with a doctorate in biotechnology and experience in beekeeping, who saw an opportunity in Alagoas, Brazil, to work with beekeepers to extract red propolis.

The company's products include red propolis extract and capsules from Alagoas, green propolis from Minas Gerais and blend extract (green and red propolis), registered with the S.I.F. (Federal Inspection Seal), playing a fundamental role in guaranteeing food safety.

Sustainability, product quality and the development of the community that works in production are all part of our work.

PRODUCTS

NCM 2106.90.30

Our products have a high pharmacological potential due to the quality of the raw materials and the excellence of their production.

We work with two of the best propolis in the world, red from Alagoas and green from Minas Gerais. These have extremely potent flavonoids and phenolic compounds that provide antimicrobial action, fighting viruses, fungi and bacteria, anti-protozoal action, antioxidant action that prevents the body from aging cells and degenerative diseases, anti-inflammatory, anti-tumor and healing action. In addition, red propolis has isoflavone, a natural estrogen that improves climacteric symptoms and prevents cardiovascular disease and osteoporosis in women.

The differentiation of our work lies in the excellence of the care and good practices of correct handling with the bees for the production of propolis, enabling this raw material to be classified as first quality, export type, which provides an extract with a very high quality of bioactive compounds.

Red Propolis from Alagoas has a distinctive chemical composition, with 4 isoflavonoids (formononetin, medicarpine, vestitol and isoliquiritigenin) never found at the same time in any type of propolis in the world, making it one of the rarest and most prized in the world.

DETAILS ON PRODUCTION CAPACITY, SEASONALITY AND OTHER CHARACTERISTICS:

The production capacity of red propolis in Alagoas is seasonal, with the increase in production beginning in the fall and winter, due to the increase in rainfall, which means that the plant that releases the raw material exudes more at this time.
